Chapter 1: XBP Configuration

The XBP uses three voltage supplies. The first supply, called $V_{CC}H$ uses 3.3 V from the XBH and powers the I^2C pull-up resistors, the activity LED, and the level shifters. The second supply, called $V_{CC}P$ uses 5 V and powers the current sense amplifier of the XBP and the power LED. The third supply is $V_{CC}D$ which powers the XBD.

1.1 Powering the XBP

In this section we only discuss how to supply $V_{CC}H$ and $V_{CC}P$. There are two options to power the XBP. Option one is to power the XBP from the XBH using the LaunchPad connector. This only works if the XBP is directly plugged into the LaunchPad connector on the XBH, we call this an XBP0. Then the XBH can supply $V_{CC}H$ and $V_{CC}P$. Please close solder jumper **SJ4** and solder jumper **SJ5** and do not connect the power connector's $V_{CC}H$ and $V_{CC}P$ pins to the XBH. They can be used to power another XBP though.

The other option is to power the XBP through the power connector on the front (see Fig. 1.1). This works for XBP0 through XBP3. Please make sure that the solder jumper **SJ4** and solder jumper **SJ5** are **open**. $V_{CC}H$ of 5 V and $V_{CC}P$ of 3.3 V can be wired to the corresponding pins on the XBH or the power connector of the XBP0 if the XBP0 is supplied directly from the XBH through the LaunchPad connectors.

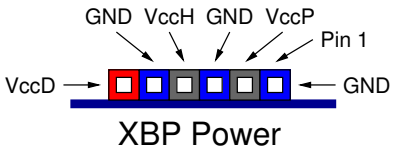

Figure 1.1: XBP Power Connector as Viewed from Front of PCB

1.1.1 Powering the XBD

Power for the XBD can be provided through the power connector's $V_{CC}D$ pin. Optionally $V_{CC}D$ can be generated on the XBP from the 5 V $V_{CC}P$. If this is desired, please populate **IC1** with an LDO voltage regulator in a SOT-89-3 package. An example is the Microchip MCP1702T-3302E/MB 3.3 V regulator.

1.2 I^2C Pull-Up Resistors

The XBP can provide the pull-up resistors for I^2C. These are needed only once on an I^2C bus. We suggest that you populate **R3** and **R4** using 10 kOhm resistors (size: 0604) on the first XBP (XBP0).

1.3 Using XBDs with $V_{CC} = 3.3\,V$

If your XBD uses a $V_{CC} = 3.3\,V$ and has a LaunchPad connector, you can plug it directly on top of the XBP. Otherwise you can use the XBD connector on the back of the XBP (see Fig. 1.2) and close solder jumpers **SJ1**, **SJ2**, and **SJ3** as you don't need voltage level shifting. In either case, please check Section 1.6 in this guide for details on particular XBDs.

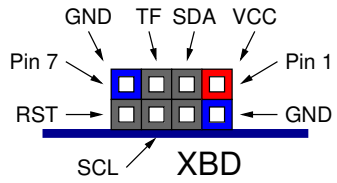

Figure 1.2: XBD Connector as Viewed from Back of PCB

1.4 Using XBDs with $V_{CC} \neq 3.3\,V$

Such XBDs can only be connected through the XBD connector on the back (Fig 1.2). The FETs Q3 through Q8 and the resistors R9 through R11 have to be populated. Please make sure that solder jumpers **SJ1**, **SJ2**, and **SJ3** are open. $V_{CC}D$ can be higher or lower than 3.3 V.

1.5 Usage without XBH

The XBP can be used also without an XBH as an experimenter's board for the INA225 current sense amplifier. The XBH requires $V_{CC}P$ of 5 V to be supplied through its power connector (see Fig. 1.1. The power for the device under test can be supplied as described in section 1.1.1. The amplified voltage drop over the shunt can be measured by through the SMA connector **X1**. The gain of the amplifier can be set through jumper JP5. The jumper settings required for the different gains are printed on the circuit board. The device under test will get its power from the XBD connector (see Fig. 1.2). Only pins 1 and 2, V_{CC} and GND respectively, have to be used.

1.6 XBX Devices under Test (XBD)

1.6.1 TI Stellaris® LM4F120 LaunchPad

Neither the Debug, nor the Device USB should be connected for power measurements. The *+3.3V* line on pin J1.1 of the boosterpack connector is connected directly to the In-Circuit Debugger. Therefore, it is recommended to select on the XBP to power the XBD via the external XBD connector and not via the boosterpack connector. On the TI Stellaris Launchpad, the VDD jumper has to be pulled and the external 3.3V has to be supplied to the right pin. The green power LED on the Launchpad lights up when the 3.3V are supplied to the left (wrong) pin. The *PWR Select* switch can be in any position and won't affect the measurements.

1.6.2 TI Tiva™ C Series TM4C123G LaunchPad

The circuit connections are the same as on the TI Stellaris LaunchPad. Please follow those instructions. Supply voltage is 3.3V with a maximum current of 300 mA.

1.6.3 TI MSP430F5529 LaunchPad™

For precise current measurements remove all jumpers from the isolation jumper block with the exception of the ground (GND) jumper.

1.6.4 TI MSP430FR6989 LaunchPad™

For precise current measurements remove all jumpers from the isolation jumper block with the exception of the ground (GND) jumper. Supply voltage is 3.3V with a maximum current of 2.7 mA not including LEDs or external circuitry.

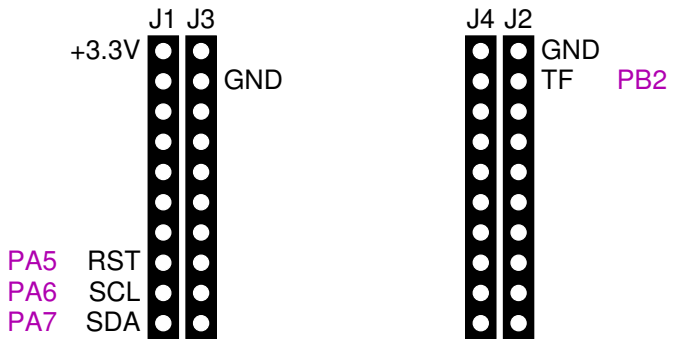

Figure 1.4: Boosterpack Connector XBD as Viewed from Top of PCB

Table 1.1: Pin Configuration of Boosterpack Connector for XBH

Connector	Pin	Net	Comment
J1	1	+3V3	Supply Voltage V_{CC}H from XBH for I^2C pull-up resistors on XBP0
J1	9	SCL	I^2C Serial Clock
J1	10	SDA	I^2C Serial Data
J3	21	+5V	Supply Voltage V_{CC}P from XBH for the XBP0
J3	23	PWR0	Analog signal of current consumption of XBD0 from XBP0
J4	37/38	GS0a/GS0b	Gain select for current monitor of XBD0 on XBP0
J4	36	TF0	Timer Flag from XBD0
J4	31	RST0	Reset of XBD0
J3	24	PWR1	Analog signal of current consumption of XBD1 from XBP1
J4	39/40	GS1a/GS1b	Gain select for current monitor of XBD1 on XBP1
J4	35	TF1	Timer Flag from XBD1
J4	32	RST1	Reset of XBD1
J3	25	PWR2	Analog signal of current consumption of XBD2 from XBP2
J2	11/12	GS2a/GS2b	Gain select for current monitor of XBD2 on XBP2
J3	29	TF2	Timer Flag from XBD2
J4	33	RST2	Reset of XBD2
J3	26	PWR3	Analog signal of current consumption of XBD3 from XBP3
J2	13/18	GS3a/GS3b	Gain select for current monitor of XBD3 on XBP3
J3	30	TF3	Timer Flag from XBD3
J4	34	RST3	Reset of XBD3
J2	20	GND	
J3	22	GND	

Table 1.2: Pin Configuration of Boosterpack Connector for XBD

Connector	Pin	Net	Comment
J1	1	+3V3	Supply Voltage, current is measured by XBP
J1	9	SCL	I^2C Serial Clock
J1	10	SDA	I^2C Serial Data
J2	16	RST	Reset of XBD
J2	19	TF	Timer Flag to start/stop execution timer on XBH
J2	20	GND	
J3	22	GND
