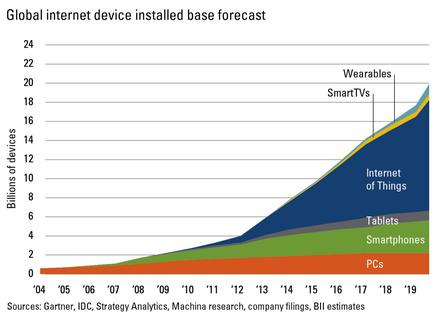
Abstract

Many cryptographic standards are determined through competitions in which candidate algorithms are evaluated for their security and performance in software as well as in hardware. The latest such competition is the Lightweight Cryptography Standardization Process by NIST. It targets in particular resource-constrained devices such as microcontrollers. The eXtended eXternal Benchmarking eXtension (XXBX) is a tool for benchmarking the performance, memory usage, and power / energy consumption of cryptographic software on microcontrollers. It is an extension to the System for Unified Performance Evaluation Related to Cryptographic Operations and Primitives (SUPERCOP) which benchmarks a large variety of cryptographic primitives on general purpose computers. XXBX extends it in the sense that it allows for benchmarking on embedded platforms and adds metrics for RAM and ROM usage as well as power / energy consumption.

Motivation

- The move to the Internet of Things (IoT) leads to formerly "dumb" devices being connected to the Internet.
- They require some level of security ⇒ cryptographic algorithms.
- IoT promises a dramatic increase in devices, many will be microcontrollers or System on Chips (SOCs).
- 32-bit microcontrollers are projected to take lead over 8/16-bit.
- 51% of all 32-bit microcontrollers were ARM based in 2012.



Benchmarking Tools

- SUPERCOP
  - System for Unified Performance Evaluation Related to Cryptographic Operations and Primitives
  - Benchmarks many implementations of many primitives across multiple operations on multiple hardware platforms.
  - Supports environments capable of running Linux and hosting a compiler.
  - Series of shell scripts and C test harnesses, and comprehensive collection of algorithm primitive implementations.
  - Verifies correct execution of implementations and times cycles required per byte processed.

`http://bench.cr.yp.to/supercop.html`

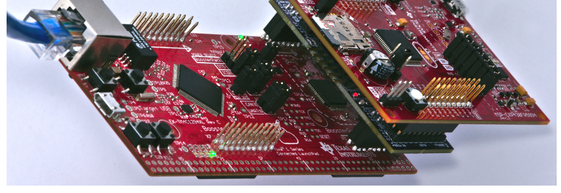
Missing Features
- Does not measure ROM usage, RAM usage, power consumption.
- Does not support cross-compilation.
- Does not support microcontrollers.

- XBX
  - eXternal Benchmarking eXtension (XBX) to SUPERCOP
  - Automated testing on real microcontrollers.
  - Compatibility with SUPERCOP algorithm collection ("algopacks") and output format.
  - Low cost hardware and software.
  - Our contribution to original XBX was to port it to the MSP430 platform and provide results for SHA-3 finalists..
  - Measures ROM and RAM usage.

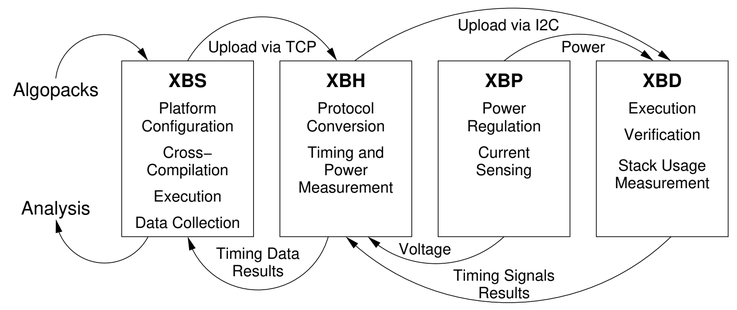
Missing Features
- Does not measure power consumption.
- Harness device (ATmega32) limits future expansion.

XXBX

eXtended eXternal Benchmarking eXtention extends the XBX by:
- Support for power and energy measurement.
- Support for Authenticated Encryption with Associated Data (AEAD) and hash functions to support NIST Lightweight Cryptography competition.
- Usage of a new harness with a powerful microcontroller running FreeRTOS.
- Rewritten software in Python 3 (was bash and perl).
- Storage of results in SQLite database.

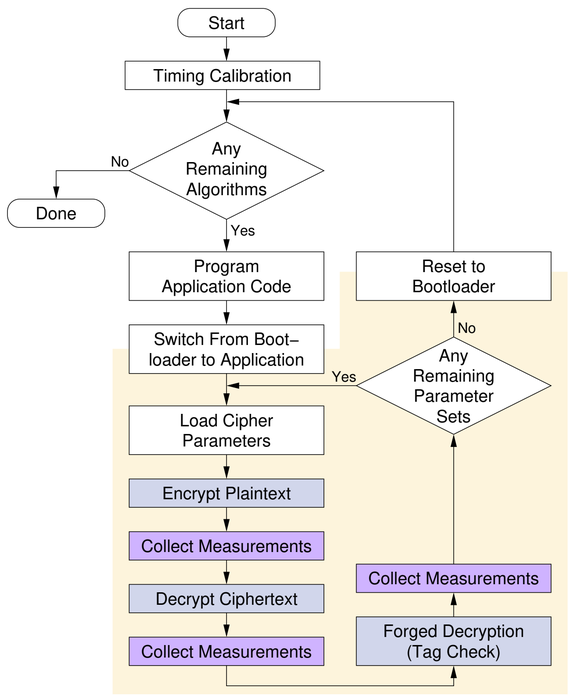


Main Components of XXBX



- XXBX Software – XBS
  - item
- XXBX Harness – XBH
  - item
- XXBX Power Shim – XBP
  - item
- XXBX Device Under Test – XBD
  - item

Benchmarking Flow



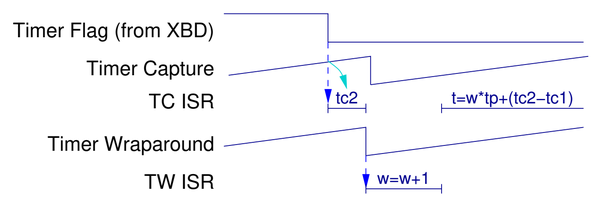
```
[hardware]
platform = msp430fr5994_16mhz
[algorithm]
operation = crypto_aead
primitives =  0cipher
              aes128n12t8silcv3
[implementation]
whitelist =  0cipher/empty
             aes128n12t8silcv3/ref
```

RAM and ROM Usage Measurement

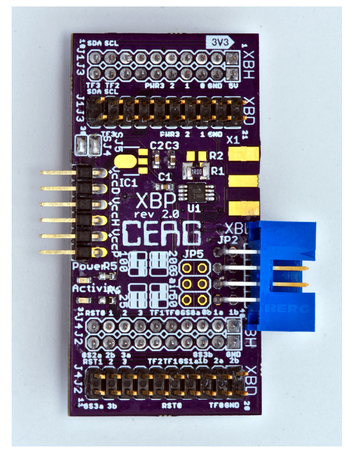
- ROM Usage
  - UNIX size command is run on generated application which reports sizes of executable sections: .bss, .data, and .text
  - The sum of the .text and .data sections is the amount of ROM that is used
- RAM Usage
  - Application paints memory with canary values
  - After execution of cipher operation, application checks the number of addresses not containing canary values
  - This is the amount of stack memory used
  - The sum of the stack usage, .data section, and .bss section is the amount of RAM that is used

Timing Measurements

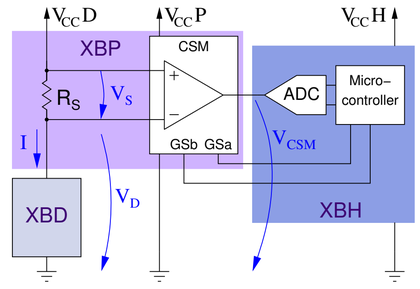
- 16-bit timer TC to capture timing flag from XBD.
- Need additional timer TW at same rate to get interrupts when timer wraps around.
- Higher priority TW counts wraps (w).
- TW can interrupt processing of TC ISR!
- Maximum time (t) is 35.8 seconds (64-bit value) at 120 MHz.



Power Measurement



- Fits between XBH and XBD
- Contains I^2C pull-ups
- Space for power regulator
- Supports XBDs with 1.2 V–5 V



CAESAR

Future Research

- Adapt XXBX to support Post Quantum Crytpography
- NIST is starting a Lightweight Cryptography Standardization Process for AEAD functions and Hash functions. The draft submission requirements were published in April 2018. XXBX will support this effort.
- Expanding to other microcontrollers incl. 8-bit.
- Combine with FOBOS to allow side-channel leakage evaluation.

Supported XBDs

Board	Manuf.	CPU	ISA	Bus	f	HW	ROM	RAM
MSP-EXP430F5529	TI	MSP430F	MSP430X	16-bit	25 MHz		12kB	10kB
MSP-EXP430FR5994	TI	MSP430FR	MSP430X	16-bit	16 MHz	AES	256kB	8kB
MSP-EXP432P401R	TI	ARM Cortex M4F	ARMv7E-M	32-bit	48 MHz	AES	256kB	64kB
